OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average one hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188), Washington, DC 20503.

1. AGENCY USE ONLY (Leave blank)		2. REPORT DATE 12/30/96		3. REPORT TYPE AND DATES COVERED Final Technical Report 10/01/94 - 09/30/96	
4. TITLE AND SUBTITLE Concentration of Pelagic Copepods in the Santa Barbara Basin				5. FUNDING NUMBERS ONR Grant N00014-95-1-0040	
6. AUTHOR(S) Kenric Osgood					
7. PERFORMING ORGANIZATION NAMES(S) AND ADDRESS(ES) Scripps Institution of Oceanography, Center for Coastal Studies 9500 Gilman Drive La Jolla, CA 92093-0209				8. PERFORMING ORGANIZATION REPORT NUMBER	
9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES) Office of Naval Research Dr. Ronald Tipper 800 North Quincy Street Arlington, VA 22217-5500				10. SPONSORING/MONITORING AGENCY REPORT NUMBER

Concentration of Pelagic Copepods in the Santa Barbara Basin

A combination of instruments (zooplankton nets, optical plankton counter, and acoustic Doppler current profiler) was used to assess the temporal and spatial extent of a dense, deep aggregation of diapausing, C5 *Calanus pacificus* in the Santa Barbara Basin (SBB) and to determine whether the abundances of *C. pacificus* and/or other copepods are elevated within the SBB compared to nearby locations. The study found high concentrations of diapausing, C5 *C. pacificus* built up in the deep waters of the SBB during the summer and into the fall. During the buildup, the deep aggregation moved up from the bottom as the oxygen became depleted in the basin's deep waters. The deep aggregation apparently builds up due to the basin trapping C5s that migrate below the sill depth from water advected over the basin. The C5s are retained within the basin until they swim, or are forced, above the sill depth. The concentrations of diapausing C5s in the deep waters outside the SBB stayed approximately constant during the summer and fall. No other zooplankton was concentrated in the SBB like the C5 *C. pacificus* were.

Two papers in peer reviewed journals have resulted from this research.
